The paddle-wheel flow sensor for continuous flow measurement is especially designed for use in neutral, slightly aggressive, solid free liquids. The sensor is made up of a compact fitting (S030) and an electronic module (SE30) quickly and easily connected together by a Quarter-Turn. The Bürkert designed fitting system ensures simple installation of the sensors into all pipe diameters from 1/4" to 2 1/2" (DN 06 to 65). The sensor produces a frequency pulse signal, proportional to the flow rate, which can easily be transmitted and processed by a Bürkert remote transmitter / indicator (Type 8025/8032).

Accuracy diagram

Design and principle of operation

The flow sensor 8030 is built up with an electronic module SE30 associated to a fitting S030 with integrated measurement paddle-wheel. This connection is made by means of a Quarter-Turn.

In a 3-wire system, the signal can be displayed or processed directly. The output signal is provided via cable plug according to EN 175301-803.

When liquid flows through the pipe, the paddle-wheel is set in rotation, producing a measuring signal in the transducer. The frequency modulated induced voltage is proportional to the flow velocity of the fluid. A conversion coefficient (K factor, available in the instruction manual of the fitting), specific to each pipe (size and material) enables the conversion of this frequency into flow rate.

Two electronic module versions with frequency output are available:

- with one pulse output (either NPN or PNP transistor output depending on wiring). An external power supply of 12-36 V DC is required. It is designed for connection to any system with open collector NPN or PNP frequency input.
- with one pulse "Low Power" output (NPN transistor output). An external power supply of 12-36 V DC is required. Can only be connected to separate versions of flow transmitters Type 8025/8032.

Pressure / temperature chart

Installation

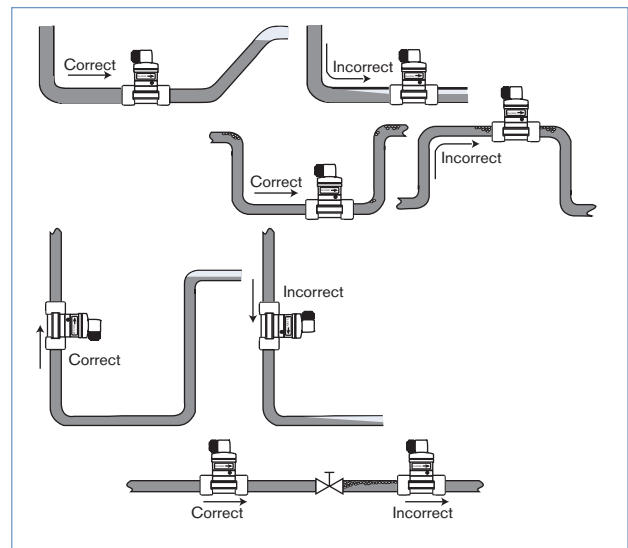

The 8030 flow sensor can easily be installed into any Bürkert INLINE fitting system Type S030, by means of a Quarter-Turn. Minimum straight upstream and downstream distances must be observed. According to the pipe's design, necessary distances can be bigger or use a flow conditioner to obtain the best accuracy.

For more information, please refer to EN ISO 5167-1.

EN ISO 5167-1 prescribes the straight inlet and outlet distances that must be complied with when installing fittings in pipe lines in order to achieve calm flow conditions. The most important layouts that could lead to turbulence in the flow are shown below, together with the associated prescribed minimum inlet and outlet distances. These ensure calm, problem-free measurement conditions at the measurement point.

The flow rate sensor can be installed into either horizontal or vertical pipes.

Pressure and temperature ratings must be respected according to the selected fitting material.

The suitable pipe size is selected using the diagram Flow / Velocity / DN.

The sensor is not designed for gas flow measurement.

Selection of fitting / pipe size

Example:

- Specification of nominal flow: 50 gpm
- Ideal flow velocity: 6 – 8 f/s
- For these specifications, the diagram indicates a pipe size of 1 1/2" (DN40) [or 2" (DN50) for (*) mentioned fittings]

Ordering chart for sensor Type 8030

A flow sensor Type 8030 consists of:

- a sensor electronic module Type SE30
- an INLINE fitting Type S030 (Refer to page 7 or corresponding datasheet)

Specifications	Voltage supply	Output	Electrical connection	Item no.
Hall (Pulse) version sensor (pluggable to Types 8025 Universal transmitter, batch controller or konti-Dos; 8032; PLC)	12-36 V DC	Frequency with pulse, PNP or NPN	Cable plug	423 913
Hall (Pulse) "Low Power" version sensor (pluggable to Types 8025, 8032 remote version)	from associated transmitter	Frequency with pulse, NPN	Cable plug	423 914
Hall (Pulse) "Low Voltage" version sensor (pluggable to PLC)	5-15 V DC	Frequency with pulse, NPN	Cable plug	554 723
